

Handcrafting Digital Experience

01

Enterprise, SaaS, CMS Applications

A curated visual journey through some of our standout work. What you see here celebrates the outcome, not necessarily the complexity behind it.

SampleMaterialBank

By Archidasia

Digital material-sourcing platform created for interior designers, architects and contractors. It enables professionals to discover, compare and request material samples through a connected e-commerce and content management ecosystem.

E-Commerce, CMS & Landing Page

Managing student sessions, therapist schedules, attendance and progress across multiple branches can quickly become fragmented. Excel Qhalif brings these workflows into one centralised platform, giving administrators and therapists a clearer way to manage daily operations and monitor student progress.

Education Management System

Ambassador / Finance Management

Mobile platform designed to support ambassador and financial-service operations, bringing customer engagement, product access and performance insights into a streamlined digital experience.

Complete digital ecosystem connecting customers, riders, merchants and platform operators across ordering, delivery and operational management. The solution combines consumer-facing applications with the supporting digital infrastructure required to run the service.

Command-centre experience designed to help security teams monitor threats, assess incidents and execute automated defensive actions from a unified interface. Complex cybersecurity information is organised into a clear operational view for faster response and decision-making.

Cybersecurity Automation

02 Geospatial & Monitoring Application

Digital products that connect location, environmental conditions, sensors and operational data to provide clearer situational awareness and support real-world decision-making.

Designed for maritime environments where conventional mobile connectivity may be unavailable. By integrating low-bandwidth satellite communication with shore-based systems, the platform enables seafarers to transmit emergency information and maintain critical communication while operating offshore.

Maritime SOS Application

LMaps provides location-based monitoring for critical plantation assets, combining geospatial information with lightning detection and sensor data. The system helps operators understand asset conditions and potential environmental risks across large operational areas.

Asset Monitoring + Remote Sensing

PrayerAtlas transforms astronomical calculations into an interactive 3D view of the Earth. Using Three.js and Takram-based rendering techniques, the platform visualises solar positioning, daylight conditions and geographic prayer-time boundaries across the globe.

Geospatial, Sun & Prayer-Time Visualisation

Make it your world.

Layers, atmosphere, and calculation rules.

PRAYER CALCULATIONS

RENDERING

Balanced

GO TO A PLACE

Kuala Lumpur

Lines show where a prayer is beginning at the selected instant. Earth's light and darkness follow the Sun; the warm horizon shows the sunrise or sunset transition. The location panel shows the latest calculated start, not the latest religiously valid prayer time.

Calculated with Adhan JS. One method applies worldwide; official local timetables can differ. High latitudes use the angle-based night rule; undefined polar events have no boundary. Umm al-Qura uses the library's fixed 90-minute interval, without a Ramadan adjustment.

03

Entertainment, Games AR & VR

Interactive experiences where storytelling, technology and play come together, ranging from mobile entertainment and augmented reality to immersive games and virtual reality experiences

Shorts Form Drama + CMS

Muviigrind is a vertical short-form drama platform powered by a scalable backend and Cloudflare video streaming, complete with an admin CMS, in-app purchases, and engaging gamification features.

Bayan

Cooperative VR spaceship escape room where one player navigates inside virtual reality while a teammate reads physical SOS instructions to solve puzzles and fix their way home.

Samudera

A 3D sailing simulation built with web technologies, primarily Three.js, as an exploration of real-time performance and rendering. Volumetric clouds dynamically reflect the colours of the horizon, while cloth-based sail physics respond to wind conditions to make the environment feel more reactive and immersive.

Wind direction directly affects the ship's movement. Sailing against or across the wind alters its trajectory, requiring the player to continuously adjust the ship's heading

Real-Time 3D Simulation + Wind Physics

KONFLIX

digital library for Asian-focused interactive stories, bringing multiple visual novels into one platform. Players explore branching narratives shaped by their choices across genres including romance, mystery and action-adventure.

Visual Novel Library

We build because we are curious.

love technology,
ambitious ideas and
the craft behind
great digital
experiences. From
practical platforms to
experimental
technology, we are
constantly exploring
what we can design,
build and push
further.
